                                                                                                                                                                                                                          g
                                                                                                                                                                                                                                                                                                                                                                    g
                                                                                          ŏ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to human RNA metabolism proteins (RWEP) and their corresponding cDNA molecules. RWEP and its DNA are used for diagnosing, treating and preventing nervous system disorders (epilepsy, dementia, stroke, Alzheimer's disease, Huntington's disease, Parkinson's disease); prion diseases; fatal familial insomnia, nutritional and metabolic diseases of the nervous system; inherited, metabolic, endocrine and toxic myopathy; mental disorders (mood, anxiety, schizophrenic disorders) amnesia and Tourste's disorder; autoimmune/inflammatory disorders (AIDS-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            arthritis, osteoporosis, pancreatitis, systemic lupus erythematosus, ulcerative colitis, and infections); cell proliferative disorders (cancer atteriosclerosis, cirrhosis, hepatitis, psoriasis); and developmental disorders (renal tubular acidosis). RMEP DNA is useful in drug screening techniques, gene therapy and for creating transgenic animals. The present sequence is human RMEP-19 cDNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   153 TAAGAACGCCTGCCACGTGGAATTGCTCTTCCTCCGCTACATCTCGGACCTAGA 212

This sequence represents the CDNA encoding human RNA editing enzyme
REE-2. CDNA encoding REE-2 was initially isolated in a prostate tumour
CC CDNA library, with the present sequence representing a conseasors. REE-2
has chemical and structural homology with the human apoB mRNA editing
cc chan a portion of the mRNA editing enzyme photobolin I (4% identity).

REE-2 was found to be expressed in a variety of cDNA libraries, a high
proportion of which were derived from tumours, neuronal tissues, immune
cc system cells or synovial tissue from arthritis patients. REE-2 is
therefore thought to be associated with the development of cancer,
c autoimmune disorders, circulatory system disorders (e.g.
C hypercholesterolaemia), viral infections and neurological diseases (e.g.
c neurofibromatosis). REE-2 or its nucleic acids may be used in the
diagnosis, treatment and prevention of such diseases via the modulation
c ftranscript editing, which in turn has effects on the encoded protein
c (e.g., an alteration in protein activity). The invention specifically
crelates to methods of detecting nucleic acids encoding human REE-2 in a
ccompany of the contraction of sample.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         7
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            510

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention relates to the isolation of novel human enzyme polypeptides (AAU22915-AAU23814), and the cDNA and genomic sequences polypeptides (aAU22915-AAU23814), and the cDNA and genomic sequences encoding them. The enzyme polypeptides of the invention may comprise the functional classes of oxidoreductases, transferases, hydrolases, lyases, isomerases or ligases. The sequences of the invention are useful in the diagnosis, treatment, prevention and/or prognosis of a wide range of diagnosis, treatment, prevention and/or prognosis of a wide range of diagnosis, treatment, prevention and/or prognosis of a wide range of diagnosis, treatment, prevention and/or prognosis of a wide range of city action of a propriative disorders (e.g. althmatis), neurological disorders (e.g. Altahmer's disease), metabolic disorders (e.g. athma), cardiovascular disorders (e.g. athmatory disorders (e.g. thempolilia), reproductive disorders (e.g. infertility) and infectious disorders (e.g. Influenca). The polynucleotides of the invention can also be used in gene therapy. AAS40785-AAS40784 represent cDNA sequences encoding for the novel human enzyme polypeptides of the invention. can also be used in pene therapy. Sequence data for this patent did not form part of the printed Note: The sequence data for this patent did not form part of the printed section but was obtained in electronic format directly from WIPO

proteins, called prostate cancer antigens, given in ABB56363 to AAB57302.
The prostate cancer antigens, given in ABB56363 to AAB57302.
The prostate cancer antigens can have neuroprotective, cytostatic, cardioactive, immunomodulatory, muscular, vulnerary, gastrointestinal, nephrotropic, antilnfective, gynaecological and antibacterial activities, and can be used in gene therapy. The prostate cancer antigen polynucleotides may be used for detection of prostate cancer, chromosome polynucleotides may be used for detection of prostate cancer, chromosome or research purposes. The prostate cancer antigens may be used to treat disorders such as neural, immune, muscular, reproductive, gastrointestinal, pulmonary, cardiovascular, renal, and proliferative gastrointestinal, pulmonary, cardiovascular, renal, and proliferative disorders, wounds, and infectious diseases. AAF16506 to AAF16514 to AAB57303 represent sequences used in the exemplification of the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human; prostate cancer; prostate cancer antigen; detection; diagnosis; neuroprotective; cytostatic; cardioactive; immunomodulatory; muscular; vulnerary; gastrointestinal; nephrotropic; antilnfective; gynaecological; antibacterial; gene therapy; neural; immune; reproductive; renal; gastrointestinal; pulmonary; cardiovascular; proliferative disorder; wound; infectious disease; ss.

                                                                                                                                                                                                                                                                                                                                                                         Sequence 34, Application US/09105537A

Patent No. 6265202

GENERAL INDOMARION:
APPLICANT: Sharman, D.H.
APPLICANT: Liu, H.
APPLICANT: Liu, H.
APPLICANT: Liu, H.
TILE OF INVENTION: DNA encoding methymycin and pikromycin
FILE REFERENCE: 600.438US1
CURRENT APPLICATION UNMBER: US/09/105,537A
CURRENT FILING DATE: 1998-06-26
NUMBER OF SEQ ID NOS: 43
SOFTWARE: FastSEQ for Windows Version 3.0
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Score 36.6; DB 4; Length 4

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

The present sequence is human activation-induced cytidine deaminase
(AID). AID structurally relates to an RNA editing enzyme APOBEC.1 and
has cytidine activity similar to APOBEC.1. AID has antiallergic,
antianaemic, antiasthmatic, ophthalmological, anti-HIV and
dermatological activities, and can be used in gene therapy. AID
colynucleotides are useful in methods for identifying drugs for the
treatment of B cell associated immune system disorders, immunodeficiency
diseases and allergies, such as immunospobulin A (19A) deficiency
disease, 1gA nephritis, gamma-globulinaemia, atopic dermatitis, allergic
colitis, asthma, food allergy, drug allergy, allergic rhinitis, Rosen
disease, DiGeorge disease, ataxia telangicetasia, common variable
immunodeficiency disease, AIDS (auto immunodeficiency syndrome), elevated
If disorder, and 1gG subclass selection disorder. The DNA sequences
encoding AID may be used for gene therapy and the antibodies to the AID
protein may be used for diagnosis and treatment of these disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     GCTAAGGGTCGGCGTGAGACCTACCTGTGCTACGTAGAGAGGCGTGACAGTGCTACA 120

      dermatological activities, and can be used in gene therapy. AlD dermatological activities, and can be used in gene therapy. AlD dermatological activities, and can be used in gene therapy. AlD treatment of Beal associated immune system disorders, immunodeficiency diseases and allergies, such as immunoglobulin A (1gA) deficiency disease. IgA nephritis, gamma-globulinaemia, atopic dermatitis, allergic colitis, asthma. food allergy, drug allergy, allergic rhinitis, Rosen disease, Dideorge disease, ataxia telangiectasia, common variable immunodeficiency disease, ALDS (auto immunodeficiency syndrome), elevated II deficiency disease, ALDS (auto immunodeficiency syndrome), elevated IGE disorder, and IgG subclass selection disorder. The DNA sequences encoding ALD may be used for gene therapy and the antibodies to the ALD protein may be used for diagnosis and treatment of these disorders.
                                                                                                                                                                                                                                                                                                          21 AlaLysGlyArgHisGluThrTyrLeuCysTyrValValLysArgArgAspSerAlaThr 40

activities which would make them suitable for treating, preventing activities which would make them suitable for treating, preventing or ameliorating medical conditions in humans and animals, although no supporting data is given. Suggested activities include nutritional activity, cytokine and cell proliferation/differentiation activity, immulating (e.g. as vaccines) or suppressing activity, hemostatic activity, chemotectic/chemokinetc activity, hemostatic activin/inhibin activity, chemotectic/chemokinetc activity, hemostatic and thrombolytic activity, receptor/ligand activity, anti-inflammatory activity, chemotectic/chemokinetc activity, and tumor inhibition activity. The PNS are also stated to be useful for gene therapy. Other activities include inhibiting the growth, infection or inhibition activity. Botcerial, fungl, viruses and other parasites; effecting bothy characteristics such as, e.g. weight, color, skin, etc., effecting blorhythms or caricadic cycles; enhancing fertility; treatment of depression; treatment of pain; hormonal or endocrine activity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               75

The invention relates to novel human secreted proteins, the nucleic acids encoding them. The protein may exhibit cytokine, cell proliferation of cell differentiation activity or may induce production of other cytokines in certain cell populations and may exhibit immune stimulating or cytokines in certain cell populations and may exhibit immune stimulating or immune suppressing activity, which is useful for the treatment of various immune deficiencies and disorders e.g. severe combined immunodefications (SCID), autoimmune disorders e.g. multiple sclerosis, systemic lupus erythematosus, rheumatoid arthritis, autoimmune pulmonary inflammation. The proteins are also useful in the treatment of diseases (TMP) in the induction of tumour immunity, and disorders including tissue, skin and organ transplantation and in graft-versus-host diseases (GWHD). In the induction of tumour immunity, in the treatment of burns, incisions and ulcers; as well as in treatment of burns, incisions and ulcers; as well as in treatment of burns, incisions and ulcers; as well as in treatment of burns, incisions and slopensis of sisease, disease, disease, disease, disease, disease, confrantant and contral nervous system, infartmatory processes, disease, ulcers, bone regeneration. The maintain activities and central nervous system vessel e.g. stroke, contraceptive based on the ability of inhibins to decrease fertility in female mammals and decrease spermatogenesis in male mammals. The proteins and nucleic acids are also useful as food supplements. The contractions are expermented protein of the invention.
